

LE1: Bubble Sort vs Merge Sort Time Complexity

STEP 7

A. SMALL DATA SET

Number of Data Elements

| Sort Algorithm | Execution Time (seconds) | | | | |
|----------------|--------------------------|--------------|--------------|--------------|--------------|
| | 1 | 2 | 3 | 4 | 5 |
| Bubble Sort | 0.0000390000 | 0.0000395000 | 0.0000411000 | 0.0000396000 | 0.0000395000 |
| Merge Sort | 0.0000315000 | 0.0000314000 | 0.0000316000 | 0.0000340000 | 0.0000320000 |

B. MEDIUM DATA SET

Number of Data Elements

| Sort Algorithm | Execution Time (seconds) | | | | |
|----------------|--------------------------|--------------|--------------|--------------|--------------|
| | 1 | 2 | 3 | 4 | 5 |
| Bubble Sort | 0.4496475000 | 0.4600797000 | 0.4510218000 | 0.4578332000 | 0.4447989000 |
| Merge Sort | 0.0029667000 | 0.0028824000 | 0.0030028000 | 0.0029983000 | 0.0029168000 |

C. LARGE DATA SET

Number of Data Elements

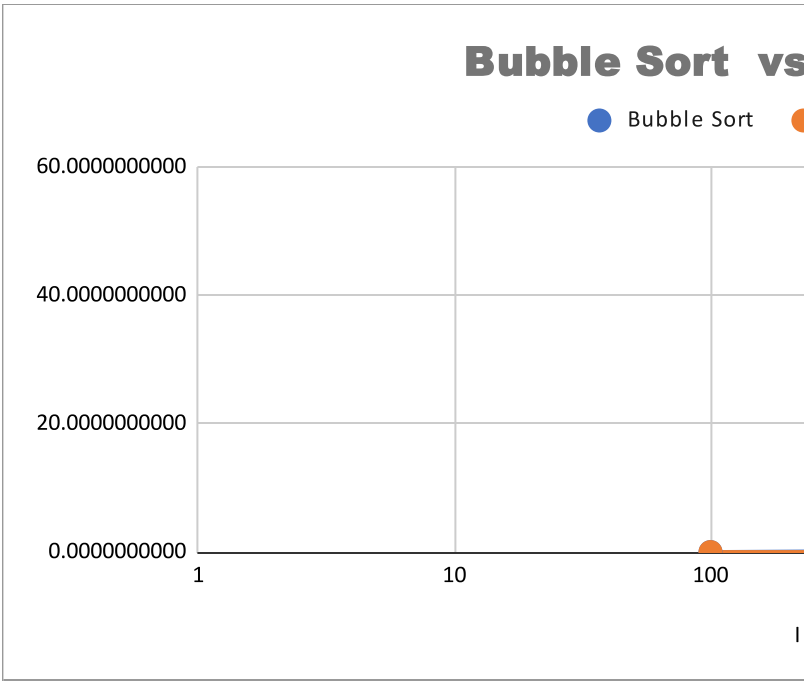

| Sort Algorithm | Execution Time (seconds) | | | | |
|----------------|--------------------------|---------------|---------------|---------------|---------------|
| | 1 | 2 | 3 | 4 | 5 |
| Bubble Sort | 54.0000469000 | 44.6067122000 | 48.9109467000 | 44.5278063000 | 50.5320228000 |
| Merge Sort | 0.0347734000 | 0.0347836000 | 0.0340212000 | 0.0332029000 | 0.0341671000 |

STEP 8

Insert the chart here.

Bubble Sort

| Input Size | Bubble Sort | Merge Sort |
|------------|---------------|--------------|
| 100 | 0.0000404400 | 0.0000456500 |
| 10000 | 0.4502552000 | 0.0030634300 |
| 100000 | 50.1831432300 | 0.0345779800 |

STEP 9

Provide your analysis here.

Based on the chart above, the merge sort consistently ran below 1 second regardless what dataset I used. Merge sort is a more efficient sorting algorithm than bubble sort, especially for large datasets. Bubble sort's execution time increases exponentially with input size, while merge sort's execution time increases linearly.

I noticed that when I used the medium dataset (10000 input size) and large dataset (100000 input size), the

With that observation, we might assume that Merge Sort will always run the fastest regardless of input size dataset with input size of 100. Of course, we may still use the Merge Sort Algorithm since it is still fast.

I, therefore, conclude that Bubble Sort is great to use with smaller datasets while Merge Sort is more efficient

STEP 10

Question 1: What is your observation in the running times of bubblesort()?

It was only fast when I used the small data set (100 input size). When I used the medium data set, it got a bit slow. I had to wait for about a minute or less for the code to finish running.

Question 2: What is your observation in the running times of mergesort()?

For Merge Sort, the runtime was consistently below 1 second.

Question 3: Based on the average running time, which one is the fastest? Explain further.

The fastest was the Bubble Sort using the small dataset because it had an average of 0.0000404400 seconds

Question 4: Based on the average running time, which one is the slowest? Explain further.

The slowest was the Bubble Sort using the large dataset because it had an average of 50.1831432300

Question 5: What can you conclude about the time complexity of Bubble Sort and Merge Sort based on you
I conclude that Bubble Sort Algorithm is best to use for small dataset input while Merge Sort Algorithm is be

Question 6: Which algorithm is more efficient for larger input sizes?

Merge Sort Algorithm

Question 7: How do your empirical findings compare to the theoretical time complexities of these algorithm

The time complexity of the Bubble Sort Algorithm is $O(n^2)$ while the Merge Sort Algorithm is $O(n \log n)$. Th
and its runtime because $O(n \log n)$ is more efficient than $O(n^2)$ and during our observation, Merge Sort Algor

on Time per Run (in secs)

| 6 | 7 | 8 | 9 | 10 | Average |
|--------------|--------------|--------------|--------------|--------------|--------------|
| 0.0000475000 | 0.0000393000 | 0.0000396000 | 0.0000402000 | 0.0000391000 | 0.0000404400 |
| 0.0000339000 | 0.0001651000 | 0.0000334000 | 0.0000319000 | 0.0000317000 | 0.0000456500 |

on Time per Run (in secs)

| 6 | 7 | 8 | 9 | 10 | Average |
|--------------|--------------|--------------|--------------|--------------|--------------|
| 0.4561440000 | 0.4375074000 | 0.4541714000 | 0.4494432000 | 0.4419049000 | 0.4502552000 |
| 0.0030731000 | 0.0031991000 | 0.0036576000 | 0.0031074000 | 0.0028301000 | 0.0030634300 |

| on Time per Run (in secs) | | | | | |
|---------------------------|---------------|---------------|---------------|---------------|---------------|
| 6 | 7 | 8 | 9 | 10 | Average |
| 46.1414857000 | 49.9194851000 | 49.5336677000 | 56.4267579000 | 57.2325010000 | 50.1831432300 |
| 0.0340038000 | 0.0359561000 | 0.0362812000 | 0.0339730000 | 0.0346175000 | 0.0345779800 |

Meanwhile, the Bubble Sort was only fast when I used the small dataset (100 input size).

runtime of the function call became considerably slower.

however that is not the case because Bubble Sort runs faster than Merge Sort if we use the small

nt to use if we will have larger datasets.

t slower and when I used the large dataset,

or empirical analysis?

is used for larger dataset input.

is?

is proves to be accurate based on our observation with our code
algorithm was more efficient to use especially if we have big datasets.
